

FeedMe Software Engineer Take Home Assignment: McDonald's Order Controller System

Lead Programmer & UI/UX Designer: Amirah Zulkifli

Video Demo: https://youtu.be/IgMIy3407PE

Programming Languages/ FrameWork/ Tools: Dart, Flutter & Visual Studio Code

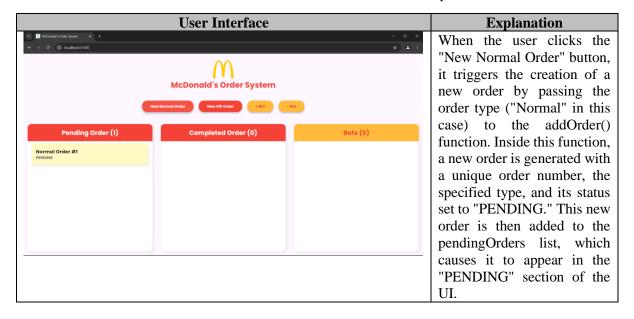

Functions	Explanations
<pre>void addOrder(String type) { setState(fn: () { // rebuild the UI with updated state final Order newOrder = Order(number: orderNumber++, type: type, status: 'PENDING'); if (type == 'VIP') { int vipIndex = pendingOrders.indexWhere(test: (Order order) => order.type != 'VIP'); if (vipIndex == -1) { //if all orders in the list are vip/empty</pre>	This function adds a new order to the pending order list with the type either "VIP" or "Normal" and assign it unique order number with a status of 'PENDING'. It also ensures that VIP orders are prioritized over normal orders where the VIP order is inserted before the first normal order.
<pre>void addBot() { setState(fn: () { final Bot bot = Bot(id: ++botCount, status: 'IDLE'); // bots.add(value: bot); //add the new bot to the list processOrders(); //assign pending orders to available }); }</pre>	This function creates a new bot with a unique id and sets its status to 'IDLE', adds it to the list of bots, and then proceed to assign pending orders to idle bots to process the order.

```
This functions processes orders by
  rocessorders() asym. {
   (var Bot bot in bots) { //lop through bots and assign orders to available bots
   (bot.status == 'IDLE' && pendingOrders.isNotEmpty) {
   final Order order = pendingOrders.firstWhere(test: (Order order) => order.status == 'PENDING');
}
                                                                                          assigning any pending order to any
                                                                                          idle bots. Each bot takes 10
   conder.status = 'PROCESSING';
bot.status = 'PROCESSING';
bot.currentOrder = order; // Assign the order to the bot
order.botId = bot.id; //asign the order's bot id
                                                                                          seconds to process one order. The
                                                                                          function will loop through each bot
                                                                                          in the bots list and check if a bot's
                                                                                          status is 'IDLE' and there are
    setstate(fn: () {
  pendingOrders.remove(value: order); //remove the order from the pending order
  completeOorders.add(value: order..status = 'COMPLETE'); //add the order to the complete or

                                                                                          pending orders, it will pick the first
                                                                                          pending order to process and
     bot.status = 'IDLE';
bot.currentOrder = null; // Clear the order after processing
                                                                                          eventually change the order's and
                                                                                          bot's status to 'PROCESSING'.
                                                                                          Once the timer finishes, the
                                                                                          pending order is removed from the
                                                                                          pending orders list and added to the
                                                                                          completed order list with the status
                                                                                          updated to 'COMPLETE'. The
                                                                                          bot's status is reset to 'IDLE'. The
                                                                                          functions
                                                                                                                   then
                                                                                          processOrders() again to check if
                                                                                          any more pending orders can be
                                                                                          processed.
  removeBot()
                                                                                          This function removes the last bot
if (bots.isNotEmpty) {
                                                                                          from the list of bots. If the removed
  setState(fn: ()
    Bot lastBot = bots.removeLast();
                                                                                          bots is in the middle of processing
                                                                                          an order, the bot's timer is
    // Check if the bot is currently processing an order
if (lastBot.status == 'PROCESSING' && lastBot.currentOrder != null) {
                                                                                          cancelled, and the order is assigned
                                                                                                  the
                                                                                                           pending
                                                                                                                            list.
                                                                                          to
      lastBot.timer?.cancel();
      lastBot.currentOrder!.status = 'PENDING'; // Set the order status b
lastBot.currentOrder = null; // Clear the bot's current order
                                                                                          processOrder() function is called
                                                                                          again to assign pending orders to
      processOrders(); // Reassign the pending orders to available bots
                                                                                          available bots.
```

Requirements:

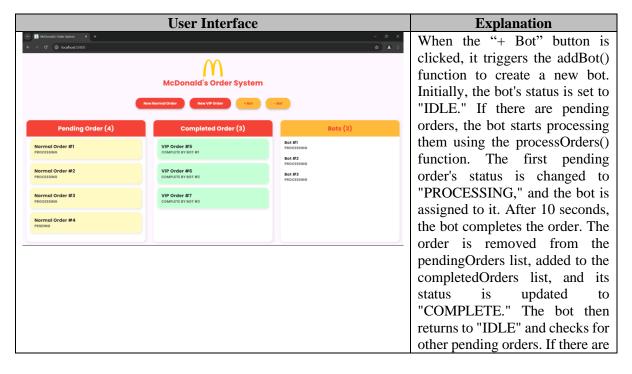

1. When "New Normal Order" clicked, a new order should show up "PENDING" Area.

2. When "New VIP Order" clicked, a new order should show up in "PENDING" Area. It should place in-front of all existing "Normal" order but behind of all existing "VIP" order.

- 3. The order number should be unique and increasing.
 - Explanation: Every new order, whether "Normal" or "VIP," is assigned a unique, incrementing order number starting from 1. The order number increases sequentially each time a new order is added, ensuring no two orders share the same number.
- 4. When "+ Bot" clicked, a bot should be created and start processing the order inside "PENDING" area. After 10 seconds picking up the order, the order should move to "COMPLETE" area. Then the bot should start processing another order if there is any left in "PENDING" area.
- 5. If there is no more order in the "PENDING" area, the bot should become IDLE until a new order come in.

more pending orders, the bot automatically begins processing the next one. If no pending orders remain, the bot stays
"IDLE" until a new order is
added.

6. When "- Bot" clicked, the newest bot should be destroyed. If the bot is processing an order, it should also stop the process. The order now back to "PENDING" and ready to process by other bot.

Explanation: When the "-Bot" is clicked, it triggers the removeBot() function to remove the most recently added bot. If the bot being removed is currently idle, it is simply removed from the bot list. If the bot is in the middle of processing an order, the bot's timer is canceled, and the order that was being processed is returned to the "PENDING" state. The order that was interrupted is now ready to be picked up by another available bot. The system reassigns it to any idle bots through the processOrders() function.
